Dry Needling for Neurological

This advanced, two-day course, led by expert Dr. Pablo Herrero, provides specialized, evidence-informed applications for managing spasticity—a common finding in patients with stroke, multiple sclerosis, and cerebral palsy. This training allows you to move decisively beyond the traditional orthopedic paradigm and into a new frontier of neurorehabilitation.

The curriculum offers a crucial deep dive into the neurological rationale, examining criteria specific to the neurological context. You will master protocols designed to interrupt disordered sensory-motor control, leading to effective spasticity reduction and improved central command.

Practically, you will master techniques that effectively reduce spasticity, significantly increase range of motion, and foster active voluntary movement. The course features essential demonstrations on incorporating ultrasound guidance to enhance needling safety and precision, ensuring you gain the confidence to immediately integrate dry needling for profound functional improvements in your neuro patients.
